<p>(54) Title: CONTRACEPTIVE COMPOSITIONS CONTAINING CYCLIC CARBAMATES AND AMIDE DERIVATIVES</p>		
<p>(57) Abstract</p> <p>This invention relates to cyclic combination therapies and regimens utilizing, in combination with progestins, estrogens, or both, substituted indoline derivative compounds which are antagonists of the progesterone receptor having general structure (I) wherein A and B are independent substituents selected from S, CH or N; provided that when A is S, B is CH or N; and when B is S, A is CH or N; and A and B cannot both be CH; and when A and B both equal N, one N may be optionally substituted with a C₁ to C₆ alkyl group; R₁ and R₂ are independent substituents selected from the group of H, C₁ to C₆ alkyl, substituted C₁ to C₆ alkyl, C₂ to C₆ alkenyl, substituted C₂ to C₆ alkenyl, C₂ to C₆ alkynyl, substituted C₂ to C₆ alkynyl, C₃ to C₈ cycloalkyl, substituted C₃ to C₈ cycloalkyl, aryl, substituted aryl, heterocyclic, substituted heterocyclic, COR^A, or NR^BCOR^A; or R¹ and R² are fused to form optionally substituted 3 to 8 membered spirocyclic alkyl, alkenyl or heterocyclic ring, the heterocyclic ring containing one to three heteroatoms selected from the group of O, S and N; or pharmaceutically useful salts thereof. These methods of treatment may be used for contraception or for the treatment and/or prevention of secondary amenorrhea, dysfunctional bleeding, uterine leiomyomata, endometriosis; polycystic ovary syndrome, carcinomas and adenocarcinomas of the endometrium, ovary, breast, colon, prostate, or minimization of side effects or cyclic menstrual bleeding. Additional uses of the invention include stimulation of food intake.</p>

CONTRACEPTIVE COMPOSITIONS CONTAINING CYCLIC CARBAMATES AND AMIDE DERIVATIVES

Field of the Invention

5 This invention relates to regimens of administering compounds which are antagonists of the progesterone receptor in combination with a progestin, an estrogen, or both.

Background of the Invention

10 Intracellular receptors (IR) form a class of structurally related genetic regulators known as "ligand dependent transcription factors" (R. M. Evans, *Science*, **240**, 889, 1988). The steroid receptor family is a subset of the IR family, including progesterone receptor (PR), estrogen receptor (ER), androgen receptor (AR), glucocorticoid receptor (GR), and mineralocorticoid receptor (MR).

15 The natural hormone, or ligand, for the PR is the steroid progesterone, but synthetic compounds, such as medroxyprogesterone acetate or levonorgestrel, have been made which also serve as ligands. Once a ligand is present in the fluid surrounding a cell, it passes through the membrane *via* passive diffusion, and binds to the IR to create a receptor/ligand complex. This complex then translocates to the
20 nucleus of the cell where it binds to a specific gene or genes present in the cell's DNA. Once bound to a specific DNA sequence the complex modulates the production of the mRNA and protein encoded by that gene.

 A compound that binds to an IR and mimics the action of the natural hormone is termed an agonist, whilst a compound which inhibits the effect of the hormone is an
25 antagonist. PR agonists (natural and synthetic) are known to play an important role in the health of women. PR agonists are used in birth control formulations, typically in the presence of an ER agonist. ER agonists are used to treat the symptoms of menopause, but have been associated with a proliferative effect on the uterus (in non-hysterectomized women) which can lead to an increased risk of uterine cancers. Co-

- 2 -

administration of a PR agonist reduces/ablates that risk. PR antagonists may also be used in contraception. In this context they may be administered alone (Ulmann, et al, *Ann. N. Y. Acad. Sci.*, **261**, 248, 1995), in combination with a PR agonist (Kekkonen, et al, *Fertility and Sterility*, **60**, 610, 1993) or in combination with a partial ER antagonist such as tamoxifen (WO 96/19997 A1, July 4, 1996).

PR antagonists may also be useful for the treatment of hormone dependent breast cancers (Horwitz, et al, *Horm. Cancer*, 283, pub: Birkhaeuser, Boston, Mass., ed. Vedeckis) as well as uterine and ovarian cancers. PR antagonists may also be useful for the treatment of non-malignant chronic conditions such as fibroids (Murphy, et al, *J. Clin. Endo. Metab.*, **76**, 513, 1993) and endometriosis (Kettel, et al, *Fertility and Sterility*, **56**, 402, 1991).

PR antagonists may also be useful in hormone replacement therapy for post menopausal patients in combination with a partial ER antagonist such as tamoxifen (US 5719136). PR antagonists such as Mifepristone have also been shown to have bone sparing effects in rodents, and as such may be useful in the treatment of osteoporosis associated with the menopause (Barengolts, et al, *Bone*, **17**, 21, 1995). PR antagonists, such as mifepristone and onapristone, have been shown to be effective in a model of hormone dependent prostate cancer, which may indicate their utility in the treatment of this condition in men (Michna, et al, *Ann. N. Y. Acad. Sci.*, **761**, 224, 1995).

Jones, et al, (U.S. Patent No. 5,688,810) described the PR antagonist dihydroquinoline 1.

1

- 3 -

Jones, *et al*, described the enol ether **2** (U.S. Patent No. 5,693,646) as a PR ligand.

**2**

5

Jones, *et al*, described compound **3** (U.S. Patent No. 5,696,127) as a PR ligand.

**3**

10

Zhi, *et al*, described lactones **4**, **5** and **6** as PR antagonists (J. Med. Chem., 41, 291, 1998).

- 4 -

Zhi, *et al.*, described the ether 7 as a PR antagonist (*J. Med. Chem.*, **41**, 291, 1998).

5

Combs, *et al.*, disclosed the amide 8 as a ligand for the PR (*J. Med. Chem.*, **38**, 4880, 1995).

5 Kurihari, *et. al.*, described the PR ligand **12** (*J. Antibiotics*, **50**, 360, 1997).

**12**

10 U.S Patent No. 5,521,166 (Grubb) teaches cyclophasic hormonal regimens comprising an antiprogestin and a progestin wherein the progestin is administered in the alternating presence and absence of an antiprogestin. The disclosed regimens also provide for use of an estrogen for a period of from 2-4 days to prevent breakthrough bleeding.

15

Description of the Invention.

This invention provides combination therapies and dosing regimens utilizing antiprogestational agents in combination with one or more progestational agents. This invention further provides methods of treatment and dosing regimens further utilizing

- 7 -

in combination with these antiprogestins and progestins, an estrogen, such as ethinyl estradiol.

These regimens and combinations may be administered to a mammal to induce contraception or for the treatment and/or prevention of secondary amenorrhea, dysfunctional bleeding, uterine leiomyomata, endometriosis; polycystic ovary syndrome, carcinomas and adenocarcinomas of the endometrium, ovary, breast, colon, prostate. Additional uses of the invention include stimulation of food intake. The uses herein for the treatment and/or prevention of the conditions or diseases described above includes the continuous administration or periodic discontinuation of administration of the invention to allow for minimization of effect dose or minimization of side effects or cyclic menstrual bleeding.

The use of this invention for contraception includes administration, preferably orally, to a female of child bearing age an antiprogestin in combination with an estrogen or progestin or both. These administration regimens are preferably carried out over 28 consecutive days, with a terminal portion of the cycle containing administration of no progestins, estrogens or anti-progestins.

The progestins of these combinations may be administered alone or in combination with an estrogen for the first 14 to 24 days of the cycle, the progestins being administered at a dosage range equal in progestational activity to about 35 µg to about 150 µg levonorgestrel per day, preferably equal in activity to from about 35 µg to about 100 µg levonorgestrel per day. An antiprogestin may then be administered alone or in combination with an estrogen for a period of 1 to 11 days to begin on any cycle day between day 14 and 24. The anti-progestin in these combinations may be administered at a dose of from about 2µg to about 50 µg per day and the estrogen may be administered at a dose of from about 10 µg to about 35 µg per day. In an oral administration, a package or kit containing 28 tablets will include a placebo tablet on those days when the antiprogestin or progestin or estrogen is not administered.

In a preferred embodiment of this invention, the progestins of this invention may be administered alone or in combination with estrogen for the initial 18 to 21 days

of a 28-day cycle, followed by administration of an antiprogestin, alone or in combination with an estrogen, for from 1 to 7 days.

The estrogen to be used in the combinations and formulations of this invention is preferably ethinyl estradiol.

5 Progestational agents useful with this invention include, but are not limited to, levonorgestrel, norgestrel, desogestrel, 3-ketodesogestrel, norethindrone, gestodene, norethindrone acetate, norgestimate, osaterone, cyproterone acetate, trimegestone, dienogest, drospirenone, nomegestrol, or (17-deacetyl)norgestimate. Among the preferred progestins for use in the combinations of this invention are levonorgestrel,
10 gestodene and trimegestone.

Examples of orally administered regimens of this invention over a 28 day cycle include administration of a progestational agent solely for the first 21 days at a daily dose equal in progestational activity to from about 35 to about 100 µg of levonorgestrel. An antiprogestin compound of this invention may then be administered
15 at a daily dose of from about 2 to 50 mg from day 22 to day 24, followed by no administration or administration of a placebo for days 25 to 28. It is most preferred that the daily dosages of each relevant active ingredient be incorporated into a combined, single daily dosage unit, totaling 28 daily units per 28-day cycle.

In another regimen, a progestational agent may be coadministered for the first
20 21 days at a daily dose equal in progestational activity to from about 35 to about 150 µg levonorgestrel, preferably equal in activity to from about 35 to about 100 µg levonorgestrel, with an estrogen, such as ethinyl estradiol, at a daily dose range of from about 10 to about 35 µg. This may be followed as described above with an antiprogestin administered at a daily dose of from about 2 to 50 mg from day 22 to day
25 24, followed by no administration or administration of a placebo for days 25 to 28.

Still another regimen within the scope of this invention will include coadministration from days 1 to 21 of a progestational agent, the progestational agent, preferably levonorgestrel, being administered at a daily dose equal in progestational activity to from about 35 to about 100 µg levonorgestrel, and an estrogen, such as

ethinyl estradiol, at a daily dose range of from about 10 to about 35 μg . This will be followed on days 22 to 24 by coadministration of an antiprogestin (2 to 50 mg/day) and an estrogen, such as ethinyl estradiol, at a daily dose of from about 10 to about 35 μg . From day 25 to day 28, this regimen may be followed by no administration or
5 administration of a placebo.

This invention also kits or packages of pharmaceutical formulations designed for use in the regimens described herein. These kits are preferably designed for daily oral administration over a 28-day cycle, preferably for one oral administration per day, and organized so as to indicate a single oral formulation or combination of oral
10 formulations to be taken on each day of the 28-day cycle. Preferably each kit will include oral tablets to be taken on each the days specified, preferably one oral tablet will contain each of the combined daily dosages indicated.

According to the regimens described above, one 28-day kit may comprise:

a) an initial phase of from 14 to 21 daily dosage units of a
15 progestational agent equal in progestational activity to about 35 to about 150 μg levonorgestrel, preferably equal in progestational activity to about 35 to about 100 μg levonorgestrel;

b) a second phase of from 1 to 11 daily dosage units of an antiprogestin compound of this invention, each daily dosage unit containing an
20 antiprogestin compound at a daily dosage of from about 2 to 50 mg; and

c) optionally, a third phase of an orally and pharmaceutically acceptable placebo for the remaining days of the cycle in which no antiprogestin, progestin or estrogen is administered.

A preferred embodiment of this kit may comprise:

a) an initial phase of 21 daily dosage units of a progestational agent
25 equal in progestational activity to about 35 to about 150 μg levonorgestrel, preferably equal in progestational activity to about 35 to about 100 μg levonorgestrel;

- 10 -

b) a second phase of 3 daily dosage units for days 22 to 24 of an antiprogestin compound of this invention, each daily dosage unit containing an antiprogestin compound at a daily dosage of from about 2 to 50 mg; and

5 c) optionally, a third phase of 4 daily units of an orally and pharmaceutically acceptable placebo for each of days 25 to 28.

Another 28-day cycle packaging regimen or kit of this invention comprises:

a) a first phase of from 18 to 21 daily dosage units of a progestational agent equal in progestational activity to about 35 to about 150 µg levonorgestrel, preferably equal in activity to from about 35 to about 100 µg levonorgestrel, and, as an
10 estrogen, ethinyl estradiol at a daily dose range of from about 10 to about 35 µg; and

b) a second phase of from 1 to 7 daily dosage units of an antiprogestin of this invention at a daily dose of from about 2 to 50 mg; and

c) optionally, an orally and pharmaceutically acceptable placebo for each of the remaining 0-9 days in the 28-day cycle in which no progestational agent,
15 estrogen or antiprogestin is administered.

A preferred embodiment of the kit described above may comprise:

a) a first phase of 21 daily dosage units of a progestational agent equal in progestational activity to about 35 to about 150 µg levonorgestrel, preferably equal in activity to from about 35 to about 100 µg levonorgestrel, and, as an estrogen,
20 ethinyl estradiol at a daily dose range of from about 10 to about 35 µg; and

b) a second phase of 3 daily dosage units for days 22 to 24 of an antiprogestin administered at a daily dose of from about 2 to 50 mg; and

c) optionally, a third phase of 4 daily dose units of an orally and pharmaceutically acceptable placebo for each of days 25 to 28.

25 A further 28-day packaged regimen or kit of this invention comprises:

a) a first phase of from 18 to 21 daily dosage units, each containing a progestational agent of this invention at a daily dose equal in progestational activity to about 35 to about 150 µg levonorgestrel, preferably equal in activity to from about 35

- 11 -

to about 100 µg levonorgestrel, and ethinyl estradiol at a daily dose range of from about 10 to about 35 µg;

b) a second phase of from 1 to 7 daily dose units, each daily dose unit containing an antiprogesterin of this invention at a concentration of from 2 to 50 mg; and
5 ethinyl estradiol at a concentration of from about 10 to about 35 µg; and

c) optionally, an orally and pharmaceutically acceptable placebo for each of the remaining 0-9 days in the 28-day cycle in which no progestational agent, estrogen or antiprogesterin is administered.

A preferred embodiment of the package or kit just described comprises:

10 a) a first phase of 21 daily dosage units, each containing a progestational agent of this invention at a daily dose equal in progestational activity to about 35 to about 150 µg levonorgestrel, preferably from about 35 to about 100 µg levonorgestrel, and ethinyl estradiol at a daily dose range of from about 10 to about 35 µg;

15 b) a second phase of 3 daily dose units for days 22 to 24, each dose unit containing an antiprogesterin of this invention at a concentration of from 2 to 50 mg; and ethinyl estradiol at a concentration of from about 10 to about 35 µg; and

c) optionally, a third phase of 4 daily units of an orally and pharmaceutically acceptable placebo for each of days 25 to 28.

20 In each of the regimens and kits just described, it is preferred that the daily dosage of each pharmaceutically active component of the regimen remain fixed in each particular phase in which it is administered. It is also understood that the daily dose units described are to be administered in the order described, with the first phase followed in order by the second and third phases. To help facilitate compliance with
25 each regimen, it is also preferred that the kits contain the placebo described for the final days of the cycle. It is further preferred that each package or kit comprise a pharmaceutically acceptable package having indicators for each day of the 28-day cycle, such as a labeled blister package or dial dispenser packages known in the art.

- 12 -

In this disclosure, the terms anti-progestational agents, anti-progestins and progesterone receptor antagonists are understood to be synonymous. Similarly, progestins, progestational agents and progesterone receptor agonists are understood to refer to compounds of the same activity.

5 These dosage regimens may be adjusted to provide the optimal therapeutic response. For example, several divided doses of each component may be administered daily or the dose may be proportionally increased or reduced as indicated by the exigencies of the therapeutic situation. In the descriptions herein, reference to a daily dosage unit may also include divided units which are administered over the course of
10 each day of the cycle contemplated.

Compounds of this invention which may be used as the anti-progestational agents in the kits, methods and regimens herein include those of the Formula 1:

15 wherein:

A and B are independent substituents selected from S, CH or N;

Provided that when A is S, B is CH or N; provided that
when B is S, A is CH or N;

20 and A and B cannot both be CH;

and when A and B both equal N, one N may be optionally substituted
with an C₁ to C₆ alkyl group;

R₁ and R₂ are independent substituents selected from the group of H,
C₁ to C₆ alkyl, substituted C₁ to C₆ alkyl, C₂ to C₆ alkenyl, substituted C₂ to C₆

- 13 -

alkenyl, C₂ to C₆ alkynyl, substituted C₂ to C₆ alkynyl, C₃ to C₈ cycloalkyl, substituted C₃ to C₈ cycloalkyl, aryl, substituted aryl, heterocyclic, substituted heterocyclic, COR^A, or NR^BCOR^A,

or R¹ and R² are fused to form:

- 5 a) an optionally substituted 3 to 8 membered spirocyclic alkyl ring, preferably a 3 to 6 membered spirocyclic alkyl ring; or
- b) an optionally substituted 3 to 8 membered spirocyclic alkenyl ring, preferably a 3 to 6 membered spirocyclic alkenyl ring; or
- 10 c) an optionally substituted 3 to 8 membered spirocyclic ring containing one to three heteroatoms selected from O, S and N, preferably a 3 to 6 membered spirocyclic ring containing one to three heteroatoms;

R^A is H, C₁ to C₃ alkyl, substituted C₁ to C₃ alkyl, aryl, substituted aryl, C₁ to C₃ alkoxy, substituted C₁ to C₃ alkoxy, C₁ to C₃ aminoalkyl, or substituted C₁ to C₃ aminoalkyl;

15 R^B is H, C₁ to C₃ alkyl, or substituted C₁ to C₃ alkyl;

R³ is H, OH, NH₂, C₁ to C₆ alkyl, substituted C₁ to C₆ alkyl, C₃ to C₆ alkenyl, substituted C₁ to C₆ alkenyl, alkynyl, or substituted alkynyl, or COR^C;

20 R^C is H, C₁ to C₃ alkyl, substituted C₁ to C₃ alkyl, aryl, substituted aryl, C₁ to C₃ alkoxy, substituted C₁ to C₃ alkoxy, C₁ to C₃ aminoalkyl, or substituted C₁ to C₃ aminoalkyl;

R⁴ is a trisubstituted benzene ring containing the substituents X, Y and Z as shown below,

25 X is selected from halogen, CN, C₁ to C₃ alkyl, substituted C₁ to C₃ alkyl, C₁ to C₃ alkoxy, substituted C₁ to C₃ alkoxy, C₁ to C₃ thioalkyl, substituted C₁ to C₃ thioalkyl, C₁ to C₃ aminoalkyl, substituted C₁ to C₃

- 14 -

aminoalkyl, NO₂, C₁ to C₃ perfluoroalkyl, 5 or 6 membered heterocyclic ring containing 1 to 3 heteroatoms, COR^D, OCOR^D, or NR^ECOR^D;

5 R^D is H, C₁ to C₃ alkyl, substituted C₁ to C₃ alkyl, aryl, substituted aryl, C₁ to C₃ alkoxy, substituted C₁ to C₃ alkoxy, C₁ to C₃ aminoalkyl, or substituted C₁ to C₃ aminoalkyl;

 R^E is H, C₁ to C₃ alkyl, or substituted C₁ to C₃ alkyl;

 Y and Z are independent independently selected from H, halogen, CN, NO₂, C₁ to C₃ alkoxy, C₁ to C₃ alkyl, or C₁ to C₃ thioalkyl;

10 or

 R⁴ is a five or six membered ring with 1, 2, or 3 heteroatoms from the group including O S, SO, SO₂ or NR⁵ and containing one or two independent substituents from the group including H, halogen, CN, NO₂ and C₁ to C₃ alkyl, C₁ to C₃ alkoxy, C₁ to C₃ aminoalkyl, COR^F, or NR^GCOR^F;

15 R^F is H, C₁ to C₃ alkyl, substituted C₁ to C₃ alkyl, aryl, substituted aryl, C₁ to C₃ alkoxy, substituted C₁ to C₃ alkoxy, C₁ to C₃ aminoalkyl, or substituted C₁ to C₃ aminoalkyl;

 R^G is H, C₁ to C₃ alkyl, or substituted C₁ to C₃ alkyl;

 R⁵ is H, or C₁ to C₃ alkyl;

20 W is O or a chemical bond
 or a pharmaceutically acceptable salt thereof.

 Among the preferred anti-progestational compounds for use with this invention are those of Formula I wherein:

25 A and B are independent substituents S, CH or N,
 provided that when A is S, B is CH or N; and
 when B is S, A is CH or N; and
 A and B cannot both be CH; and

when A and B both equal N, one N may be optionally substituted with an C₁ to C₆ alkyl group;

5 R¹ is H, C₁ to C₆ alkyl, substituted C₁ to C₆ alkyl, C₃ to C₈ cycloalkyl, substituted C₃ to C₈ cycloalkyl, aryl, substituted aryl, heterocyclic, substituted heterocyclic, COR^A, or NR^BCOR^A;

R² is H, C₁ to C₆ alkyl, substituted C₁ to C₆ alkyl, C₂ to C₆ alkenyl, substituted C₂ to C₆ alkenyl, C₂ to C₆ alkynyl, substituted C₂ to C₆ alkynyl, C₃ to C₈ cycloalkyl, substituted C₃ to C₈ cycloalkyl, aryl, substituted aryl, heterocyclic, substituted heterocyclic, COR^A, or NR^BCOR^A;

10 or R¹ and R² are fused to form:

a) an optionally substituted 3 to 8 membered spirocyclic alkyl ring; or

b) an optionally substituted 3 to 8 membered spirocyclic alkenyl ring; or

15 c) an optionally substituted 3 to 8 membered spirocyclic ring containing one to three heteroatoms selected from the group of O, S and N;

20 R^A is H, C₁ to C₃ alkyl, substituted C₁ to C₃ alkyl, aryl, substituted aryl, C₁ to C₃ alkoxy, substituted C₁ to C₃ alkoxy, C₁ to C₃ aminoalkyl, or substituted C₁ to C₃ aminoalkyl;

R^B is H, C₁ to C₃ alkyl, or substituted C₁ to C₃ alkyl;

R³ is H, OH, NH₂, C₁ to C₆ alkyl, substituted C₁ to C₆ alkyl, C₃ to C₆ alkenyl, substituted C₁ to C₆ alkenyl, alkynyl, or substituted alkynyl, or COR^C;

25 R^C is H, C₁ to C₄ alkyl, substituted C₁ to C₄ alkyl, aryl, substituted aryl, C₁ to C₄ alkoxy, substituted C₁ to C₄ alkoxy, C₁ to C₄ aminoalkyl, or substituted C₁ to C₄ aminoalkyl;

R⁴ is a trisubstituted benzene ring containing the substituents X, Y and Z as shown below:

- 16 -

X is taken from the group including halogen, CN, C₁ to C₃ alkyl, substituted C₁ to C₃ alkyl, C₁ to C₃ alkoxy, substituted C₁ to C₃ alkoxy, C₁ to C₃ thioalkyl, substituted C₁ to C₃ thioalkyl, C₁ to C₃ aminoalkyl, substituted C₁ to C₃ aminoalkyl, NO₂, C₁ to C₃ perfluoroalkyl, 5-membered heterocyclic ring containing 1 to 3 heteroatoms, COR^D, OCOR^D, or NR^ECOR^D;

R^D is H, C₁ to C₃ alkyl, substituted C₁ to C₃ alkyl, aryl, substituted aryl, C₁ to C₃ alkoxy, substituted C₁ to C₃ alkoxy, C₁ to C₃ aminoalkyl, or substituted C₁ to C₃ aminoalkyl;

R^E is H, C₁ to C₃ alkyl, or substituted C₁ to C₃ alkyl;

Y and Z are independent substituents taken from the group including H, halogen, CN, NO₂, C₁ to C₃ alkoxy, C₁ to C₃ alkyl, or C₁ to C₃ thioalkyl;

or

R⁴ is a five or six membered ring with 1, 2, or 3 heteroatoms from the group including O, S, SO, SO₂ or NR⁵ and containing one or two independent substituents from the group including H, halogen, CN, NO₂ and C₁ to C₃ alkyl, or C₁ to C₃ alkoxy;

R⁵ is H or C₁ to C₃ alkyl;

W is O or a chemical bond

or a pharmaceutically acceptable salt thereof.

Further preferred progesterone receptor antagonists are those of Formula I wherein:

A and B are independent substituents from the group including S, CH or N;

provided that when A is S, B is CH or N; and

when B is S, A is CH or N; and

- 17 -

A and B cannot both be CH₃;

R¹ = R² and are selected from the group which includes C₁ to C₃ alkyl, substituted C₁ to C₃ alkyl, or spirocyclic alkyl constructed by fusing R¹ and R² to form a 3 to 6 membered spirocyclic ring;

5 R³ is H, OH, NH₂, C₁ to C₆ alkyl, substituted C₁ to C₆ alkyl, or COR^C;

R^C is H, C₁ to C₄ alkyl, or C₁ to C₄ alkoxy;

R⁴ is a disubstituted benzene ring containing the substituents X and Y as shown below:

10 X is selected from the group including halogen, CN, C₁ to C₃ alkoxy, C₁ to C₃ alkyl, NO₂, C₁ to C₃ perfluoroalkyl, 5 membered heterocyclic ring containing 1 to 3 heteroatoms, or C₁ to C₃ thioalkyl;

Y is a substituent on the 4' or 5' position selected from the group of H, halogen, CN, NO₂, C₁ to C₃ alkoxy, C₁ to C₄ alkyl, or C₁ to C₃ thioalkyl;

15

or

R⁴ is a five membered ring with the structure shown below:

U is O, S, or NR⁵;

20

R⁵ is H, or C₁ to C₃ alkyl, or C₁ to C₄ CO₂alkyl;

X' is selected from halogen, CN, NO₂, C₁ to C₃ alkyl or C₁ to C₃ alkoxy;

- 18 -

Y' is H or C₁ to C₄ alkyl;

or

R⁴ is a six membered ring with the structure:

5 X¹ is N or CX²;

X² is halogen, CN or NO₂;

W is O or a chemical bond; or a pharmaceutically acceptable salt thereof.

The anti-progestational compounds of this invention may contain an asymmetric carbon atom and some of the compounds of this invention may contain one
 10 or more asymmetric centers and may thus give rise to optical isomers and diastereomers. While shown without respect to stereochemistry in Formula I, II, and III, the present invention includes such optical isomers and diastereomers; as well as the racemic and resolved, enantiomerically pure R and S stereoisomers; as well as other mixtures of the R and S stereoisomers and pharmaceutically acceptable salts
 15 thereof.

The term "alkyl" is used herein to refer to both straight- and branched-chain saturated aliphatic hydrocarbon groups having from one to 8 carbon atoms, preferably from 1 to 6 carbon atoms; "alkenyl" is intended to include both straight- and branched-chain alkyl group having from 2 to 8 carbon atoms, preferably 2 to 6 carbon
 20 atoms, with at least one carbon-carbon double bond; "alkynyl" group is intended to cover both straight- and branched-chain alkyl group having from 2 to 8 carbon atoms, preferably 2 to 6 carbon atoms, with at least one carbon-carbon triple bond.

The terms "substituted alkyl", "substituted alkenyl", and "substituted alkynyl" refer to alkyl, alkenyl, and alkynyl as just described having one or more substituents
 25 from the group including halogen, CN, OH, NO₂, amino, aryl, heterocyclic, substituted aryl, substituted heterocyclic, alkoxy, aryloxy, substituted alkyloxy, alkylcarbonyl, alkylcarboxy, alkylamino, arylthio. These substituents may be attached to any carbon

of alkyl, alkenyl, or alkynyl group provided that the attachment constitutes a stable chemical moiety.

The term "aryl" is used herein to refer to an aromatic system which may be a single ring or multiple aromatic rings fused or linked together as such that at least one
5 part of the fused or linked rings forms the conjugated aromatic system. The aryl groups include but not limited to phenyl, naphthyl, biphenyl, anthryl, tetrahydronaphthyl, phenanthryl.

The term "substituted aryl" refers to aryl as just defined having one or more substituents from the group including halogen, CN, OH, NO₂, amino, alkyl, cycloalkyl,
10 alkenyl, alkynyl, alkoxy, aryloxy, substituted alkyloxy, alkylcarbonyl, alkylcarboxy, alkylamino, or arylthio.

The term "heterocyclic" is used herein to describe a stable 4- to 7-membered monocyclic or a stable multicyclic heterocyclic ring which is saturated, partially
15 unsaturated, or unsaturated, and which consists of carbon atoms and from one to four heteroatoms selected from the group including N, O, and S atoms. The N and S atoms may be oxidized. The heterocyclic ring also includes any multicyclic ring in which any of above defined heterocyclic rings is fused to an aryl ring. The heterocyclic ring may be attached at any heteroatom or carbon atom provided the resultant structure is chemically stable. Such heterocyclic groups include, for example, tetrahydrofuran,
20 piperidinyl, piperazinyl, 2-oxopiperidinyl, azepinyl, pyrrolidinyl, imidazolyl, pyridyl, pyrazinyl, pyrimidinyl, pyridazinyl, oxazolyl, isoxazolyl, morpholinyl, indolyl, quinolinyl, thienyl, furyl, benzofuranyl, benzothienyl, thiamorpholinyl, thiamorpholinyl sulfoxide, and isoquinolinyl.

The term "substituted heterocyclic" is used herein to describe the heterocyclic
25 just defined having one or more substituents selected from the group which includes halogen, CN, OH, NO₂, amino, alkyl, substituted alkyl, cycloalkyl, alkenyl, substituted alkenyl, alkynyl, alkoxy, aryloxy, substituted alkyloxy, alkylcarbonyl, alkylcarboxy, alkylamino, or arylthio. The term "alkoxy" is used herein to refer to the OR group, where R is alkyl or substituted alkyl. The term "aryloxy" is used herein to refer to the

- 20 -

OR group, where R is aryl or substituted aryl. The term "alkylcarbonyl" is used herein to refer to the RCO group, where R is alkyl or substituted alkyl. The term "alkylcarboxy" is used herein to refer to the COOR group, where R is alkyl or substituted alkyl. The term "aminoalkyl" refers to both secondary and tertiary amines wherein the alkyl or substituted alkyl groups may be either same or different and the point of attachment is on the nitrogen atom. The term "thioalkyl" is used herein to refer to the SR group, where R is alkyl or substituted alkyl. The term "halogen" refers to Cl, Br, F, and I element.

10 The anti-progestin compounds of this invention can be prepared following the Schemes illustrated below:

CYCLOCARBAMATE DERIVATIVES

15 **Processes for preparing thiophene cyclocarbamate derivatives**

A. Methods for synthesizing the thiophene cyclocarbamate compounds depicted in Scheme 1 are described below:

- 21 -

Thus the amino thiophene ester 2 was prepared according to a literature procedure involving the Gewald reaction (see Comprehensive Heterocyclic Chemistry

5 II. A Review of the Literature 1982-1995. A.R. Katritzky et al. Vol. 2 page 639), i.e. the reaction of a suitably substituted aromatic acetaldehyde with sulfur and methyl cyanoacetate in refluxing methanol (Scheme 1). Reaction of the 2-amino group with a suitable chloroformate or carbonate affords the protected amine 3. This can be accomplished by allowing 2 to react with a chloroformate or carbonate derivative such

10 as methyl chloroformate, ethyl chloroformate, allyl chloroformate, 2-(trimethylsilyl)ethyl chloroformate or di-tert-butyl dicarbonate in a solvent such as benzene, toluene, xylene, dichloromethane, tetrahydrofuran or pyridine. The reaction can be carried out under an inert atmosphere (nitrogen or argon) from 0°C up to the reflux temperature of the solvent and may require the presence of a base such as 4-

- 22 -

- dimethylaminopyridine, triethylamine, pyridine or di-isopropyl ethylamine. Treatment of the protected amino compound 3 with an organo-metallic reagent such as a Grignard reagent, an alkyl or aryl-zinc reagent, an alkyl or aryl lithium reagent in an inert solvent (tetrahydrofuran, diethylether) under an inert atmosphere (nitrogen or argon) at a suitable temperature from 0°C up to reflux temperature of the solvent will then provide the tertiary alcohol 4. Compound 4 may then be subjected to basic conditions to effect ring closure to give the cyclocarbamate derivative 5. Suitable conditions would involve treatment of 4 with a base such as potassium hydroxide in a solvent such as ethanol or potassium t-butoxide in a solvent such as tetrahydrofuran.
- The reaction can be carried out in an inert atmosphere (nitrogen or argon) from 0°C up to the reflux temperature of the solvent.

Scheme 2

- Alternatively the carbamate protecting group present in 4 may be removed under conditions appropriate for its removal to afford 6 (Scheme 2). Subsequent ring closure of 6 with a reagent such as phosgene, carbonyldiimidazole or dimethyl carbonate in an appropriate solvent (tetrahydrofuran, dichloromethane, benzene, etc.) also will provide access to 5.

20

- 23 -

Scheme 3

Alternatively, compound 4 may be dehydrated to afford the isopropene derivative 7 (Scheme 3). Suitable conditions for the dehydration would be the use of a reagent such as acetic anhydride, methanesulfonyl chloride, p-toluenesulfonyl chloride or trifluoromethane sulfonyl chloride or anhydride, in a solvent such as pyridine, tetrahydrofuran, dichloromethane or benzene. The reaction can be carried out under an inert atmosphere (nitrogen or argon) from 0°C up to the reflux temperature of the solvent and may require the presence of a base such as 4-dimethylaminopyridine, triethylamine, pyridine or di-isopropyl ethylamine. Exposure of 7 to acidic conditions would then afford ring closure to give 5. Suitable conditions would be the use of an acid such as p-toluenesulfonic acid, methanesulfonic acid or camphorsulfonic acid in a solvent such as dichloromethane, benzene, toluene or tetrahydrofuran. The reaction can be carried out under an inert atmosphere (nitrogen or argon) from 0°C up to the reflux temperature of the solvent.

Scheme 4

An alternative route to **5** is shown in Scheme 4. Treatment of the previously described compound **8** (M. Sugiyama, T. Sakamoto, K. Tabata, K. Endo, K. Ito, M. Kobayashi, H. Fukiumi, Chem. Pharm. Bull., 37(8): 2091 (1989)) with an organo-metallic reagent such as a Grignard reagent, an alkyl or aryl zinc reagent, an alkyl or aryl lithium reagent in an inert solvent (tetrahydrofuran, diethylether) under an inert atmosphere (nitrogen or argon) at a suitable temperature from 0° C up to reflux temperature of the solvent will then provide the tertiary alcohol **9**. Compound **9** may then be subjected to basic conditions to effect ring closure to give the cyclocarbamate derivative **10**. Suitable conditions would involve treatment of **10** with a base such as potassium hydroxide in a solvent such as ethanol or potassium t-butoxide in a solvent such as tetrahydrofuran. The reaction can be carried out in an inert atmosphere (nitrogen or argon) from 0° C up to the reflux temperature of the solvent. Compound **10** may then be converted to the brominated derivative **11**. Suitable conditions would be treatment with bromine or N-bromosuccinimide in a solvent such as dichloromethane, tetrahydrofuran or acetic acid. The reaction can be carried out in an inert atmosphere (nitrogen or argon) from 0° C up to the reflux temperature of the solvent in the presence of an additive such as silica gel. Subsequent reaction of **11** with an aryl or heteroaryl boronic acid, boronic acid anhydride or trialkyl stannane then

- 25 -

provides access to the desired biaryl compound **5**. The reaction can be carried out in a solvent such as acetone, ethanol, benzene, toluene or tetrahydrofuran, under an inert atmosphere (nitrogen or argon) from 0° C up to the reflux temperature of the solvent, in the presence of a palladium catalyst such as tetrakis(triphenylphosphine)palladium (0) or palladium acetate and may require an additive such as sodium carbonate, cesium fluoride or potassium phosphate.

Scheme 5

Alternatively, **10** (Scheme 5) may be treated at low temperature with a reagent such as an alkyl lithium or lithium amide in an inert solvent such as tetrahydrofuran, and then converted to a boronic acid **12** (M = B(OH)₂) under the action of trimethyl or triisopropyl borate, or into a stannane via reaction with trimethyltin chloride or bis(trimethyltin). Subsequent reaction of **12** with an aryl or heteroaryl bromide or iodide in the presence of a palladium catalyst such as tetrakis(triphenylphosphine) palladium (0) or palladium acetate and may require an additive such as sodium carbonate, cesium fluoride or potassium phosphate, would then effect conversion into the desired thiophene cyclocarbamate **5**.

B. Methods for synthesizing the thiophene cyclocarbamate compounds depicted in Scheme 6 are described below:

- 26 -

Scheme 6

The amino thiophene compounds **15** (Scheme 6) are prepared according to a literature procedure (Comprehensive Heterocyclic Chemistry II. A Review of the Literature 1982-1995. A.R. Katrisky et al., Vol. 2, page 639) which involves treating a suitably substituted aromatic methyl ketone **13** with phosphorus oxychloride in N,N-dimethyl formamide to afford the chloro cyano olefin derivative **14**. Allowing **14** to react with methyl mercaptoacetate in methanol containing sodium methoxide affords the key aminothiophene carboxylate starting material. Reaction of the 2-amino group with a suitable chloroformate or carbonate affords the protected amine **16**. This can be accomplished by allowing **15** to react with a chloroformate or carbonate derivative such as methyl chloroformate, ethyl chloroformate, allyl chloroformate, 2-(trimethylsilyl)ethyl chloroformate or di-tert-butyl dicarbonate in a solvent such as

benzene, toluene, xylene, dichloromethane, tetrahydrofuran or pyridine. The reaction can be carried out under an inert atmosphere (nitrogen or argon) from 0° C up to the reflux temperature of the solvent and may require the presence of a base such as 4-dimethylaminopyridine, triethylamine, pyridine or di-isopropyl ethylamine. Treatment of the protected amino compound 16 with an organo-metallic reagent such as a Grignard reagent, an alkyl or aryl-zinc reagent, an alkyl or aryl lithium reagent in an inert solvent (tetrahydrofuran, diethylether) under an inert atmosphere (nitrogen or argon) at a suitable temperature from 0° C up to reflux temperature of the solvent will then provide the tertiary alcohol 17. Compound 17 may then be subjected to basic conditions to effect ring closure to give the cyclocarbamate derivative 18. Suitable conditions would involve treatment of 4 with a base such as potassium hydroxide in a solvent such as ethanol or potassium t-butoxide in tetrahydrofuran. The reaction can be carried out in an inert atmosphere (nitrogen or argon) from 0° C up to the reflux temperature of the solvent.

Scheme 7

Alternatively the carbamate protecting group present in 17 may be removed under conditions appropriate for its removal to afford 19 (Scheme 7). Subsequent ring closure of 19 with a reagent such as phosgene, carbonyldiimidazole or dimethyl carbonate in an appropriate solvent (tetrahydrofuran, dichloromethane, benzene, etc.) also will provide access to 18.

- 28 -

Scheme 8

Alternatively, compound 17 may be dehydrated to afford the isopropene derivative 20 (Scheme 8). Suitable conditions for the dehydration would be the use of a reagent such as acetic anhydride, methanesulfonyl chloride, p-toluenesulfonyl chloride or trifluoromethane sulfonyl chloride or anhydride, in a solvent such as pyridine, tetrahydrofuran, dichloromethane or benzene. The reaction can be carried out under an inert atmosphere (nitrogen or argon) from 0°C up to the reflux temperature of the solvent and may require the presence of a base such as 4-dimethylaminopyridine, triethylamine, pyridine or di-isopropyl ethylamine. Exposure of 20 to acidic conditions would then afford ring closure to give 18. Suitable conditions would be the use of an acid such as p-toluenesulfonic acid, methanesulfonic acid or camphorsulfonic acid in a solvent such as dichloromethane, benzene, toluene or tetrahydrofuran. The reaction can be carried out under an inert atmosphere (nitrogen or argon) from 0°C up to the reflux temperature of the solvent.

15

- 29 -

- An alternative route to **18** is shown in Scheme 9. Treatment of the previously described compound **21**, as taught by H. Fukiumi, M. Sugiyama, T. Sakamoto, *Chem Pharm. Bull.*, **37**(5):1197 (1989), with an organo-metallic reagent such as a Grignard reagent, an alkyl or aryl zinc reagent, an alkyl or aryl lithium reagent in an inert solvent (tetrahydrofuran, diethylether) under an inert atmosphere (nitrogen or argon) at a suitable temperature from 0° C up to reflux temperature of the solvent will then provide the tertiary alcohol **22**. Compound **22** may then be subjected to basic conditions to effect ring closure to give the cyclocarbamate derivative **23**. Suitable conditions would involve treatment of **22** with a base such as potassium hydroxide in a solvent such as ethanol or potassium t-butoxide in tetrahydrofuran. The reaction can be carried out in an inert atmosphere (nitrogen or argon) from 0° C up to the reflux temperature of the solvent. Compound **23** may then be converted to the brominated derivative **24**. Suitable conditions would be treatment with bromine or N-bromosuccinimide in a solvent such as dichloromethane, tetrahydrofuran or acetic acid. The reaction can be carried out in an inert atmosphere (nitrogen or argon) from 0° C up to the reflux temperature of the solvent in the presence of an additive such as silica gel. Subsequent reaction of **24** with an aryl or heteroaryl boronic acid anhydride or trialkyl stannane then provides access to the desired biaryl compound **18**. The reaction can be carried out in a solvent such as acetone, ethanol, benzene, toluene

- 30 -

or tetrahydrofuran, under an inert atmosphere (nitrogen or argon) from 0° C up to the reflux temperature of the solvent, in the presence of a palladium catalyst such as tetrakis(triphenylphosphine)palladium (0) or palladium acetate and may require an additive such as sodium carbonate, cesium fluoride or potassium phosphate.

Scheme 10

5

Alternatively, 23 (Scheme 10) may be treated at low temperature with a reagent such as an alkyl lithium or lithium amide in an inert solvent such as tetrahydrofuran, and then converted to a boronic acid 25 (M= B(OH)₂) under the action of trimethyl or triisopropyl borate, or into a stannane via reaction with trimethyltin chloride or bis(trimethyltin). Subsequent reaction of 25 with an aryl or heteroaryl bromide or iodide in the presence of a palladium catalyst such as tetrakis(triphenylphosphine) palladium (0) or palladium acetate and may require an additive such as sodium carbonate, cesium fluoride or potassium phosphate, would then effect conversion into the desired thiophene cyclocarbamate 18.

10

15

C. Method for synthesizing the thiophene thiocyclocarbamate compounds 26 and 27 depicted in Scheme 11 are described below:

Scheme 11

Thiophene thiocyclocarbamates **26** and **27** may be obtained directly by treating **5** and **18** respectively with phosphorus pentasulfide in refluxing pyridine. Alternatively **5** and **18** may be treated with Lawesson's reagent ([2,4-bis(4-methoxyphenyl)-1,3-dithia-2,4-diphosphetane-2,4-disulfide]) in refluxing pyridine to afford **26** and **27**, respectively.

Process for making thiazole cyclocarbamate derivatives.

10 Methods for preparing the thiazole cyclocarbamate compounds are described below.

- 32 -

Scheme 12

Thus the thiazole **28** was prepared according to a literature procedure, scheme12 by B. Golankiewicz and P. Januszczyk, *Tetrahedron*, **41**:5989 (1985). Reaction of the amine **28** with a suitable chloroformate or carbonate then gives the protected amine **29**. This may be accomplished by reacting compound **28** with a chloroformate or carbonate derivative such as methylchloroformate, ethylchloroformate, allylchloroformate, 2-(trimethylsilyl)ethylchloroformate or di-tert-butylidicarbonate in a solvent such as dichloromethane, THF, benzene, xylene or pyridine. The reaction can be carried out under an inert atmosphere (nitrogen or argon) from 0 °C up to the reflux temperature of the solvent and may require the presence of a base such as 4-dimethylaminopyridine, triethylamine, pyridine or diisopropyl ethylamine. Exposure of compound **29** to an organo-metallic reagent such as a Grignard reagent, an alkyl or aryl-zinc reagent, an alkyl or aryl lithium reagent in an inert solvent (THF, diethyl ether) under an inert atmosphere (nitrogen or argon) at a suitable temperature from 0 °C up to the reflux temperature of the solvent will then provide the alcohol **30**. Compound **30** may then be exposed to basic conditions to effect ring closure to give the cyclocarbamate derivative **31**. Suitable conditions would involve treatment of compound **30** with a base such as potassium hydroxide in a

- 33 -

solvent such as ethanol. The reaction can be carried out under an inert atmosphere (nitrogen or argon) from 0 °C up to the reflux temperature of the solvent.

Scheme 13

Alternatively the carbamate protecting group present in compound 30 may be removed under conditions appropriate for its removal to afford compound 32 as taught by T.W. Greene and P.G.M. Wuts, *Protective Groups in Organic Synthesis*, second ed., Wiley-Interscience (1991). Subsequent ring closure of compound 32 with a reagent such as phosgene, carbonyl diimidazole or dimethyl carbonate in an appropriate solvent (THF, dichloromethane, benzene, etc) will also provide access to compound 31.

Scheme 14

Alternatively, if compound 30 is a tertiary alcohol then it may be dehydrated to afford the isopropene derivative 33, scheme 3. Suitable conditions for the dehydration would be the use of a reagent such as acetic anhydride, methanesulfonyl chloride, p-

- 34 -

toluenesulfonyl chloride or trifluoromethane sulfonyl chloride or anhydride, in a solvent such as pyridine, THF, dichloromethane or benzene. The reaction can be carried out under an inert atmosphere (nitrogen or argon) from 0 °C up to the reflux temperature of the solvent and may require the presence of a base such as 4-

5 dimethylaminopyridine, triethylamine, pyridine or di-isopropyl ethylamine. Exposure of compound **33** to acidic conditions would then afford ring closure to give compound **31**. Suitable conditions would be the use of an acid such as p-toluenesulfonic acid, methanesulfonic acid or camphorsulfonic acid in a solvent such as dichloromethane, benzene, toluene or THF and the reaction can be carried out under an inert atmosphere

10 (nitrogen or argon) from 0 °C up to the reflux temperature of the solvent.

Scheme 15

15

Compound **31** may then be converted into the bromide **34**, scheme 15. Suitable conditions would be exposure to bromine or N-bromosuccinimide in a solvent such as dichloromethane, THF or acetic acid, the reaction can be carried out under an inert atmosphere (nitrogen or argon) from 0 °C up to the reflux temperature of the solvent

20 in the presence of an additive such as silica gel. Subsequent reaction of compound **34** with an aryl or heteroaryl boronic acid, boronic acid anhydride or trialkyl stannane then provides access to the desired biaryl compound **35**. The reaction can be carried out in a solvent such as acetone, ethanol, benzene, toluene or THF, under an inert atmosphere (nitrogen or argon) from 0 °C up to the reflux temperature of the solvent,

25 in the presence of a palladium catalyst such as tetrakis(triphenylphosphine) palladium

(0) or palladium acetate and may require an additive such as sodium carbonate, cesium fluoride or potassium phosphate.

5

Scheme 16

Alternatively compound 31 may be treated at low temperature with a reagent such as an alkyl lithium or lithium amide in an inert solvent such as THF, and then converted into a boronic acid ($M = B(OH)_2$) 36 under the action of trimethyl or trisopropyl borate, or into a stannane under the action of trimethyltin chloride or bis(trimethyltin), Scheme 16. Subsequent reaction with an aryl or heteroaryl bromide or iodide in the presence of a palladium catalyst such as tetrakis(triphenylphosphine) palladium (0) or palladium acetate and may require an additive such as sodium carbonate, cesium fluoride or potassium phosphate would then effect conversion into the desired compound 35.

10
15

AMIDE DERIVATIVES

20 **Process for making amide thiophene derivatives.**

A method for preparing thiophene derivatives is described below, scheme 17.

- 36 -

Scheme 17

- 5 Thus the amine 37 is converted into a carbamate, such as a *tert*-butyl carbamate as described in scheme 1 for the preparation of compound 2. Hydrolysis of the ester 38 under basic conditions, for example lithium or sodium hydroxide in THF or methanol at room temperature then gives the acid 39. Conversion of the acid 39 into the acid chloride 40 is accomplished under standard conditions, thionyl chloride or oxalyl chloride either neat or in the presence of a solvent such as dichloromethane and an additive such as a catalytic amount of N,N-dimethylformamide. Compound 40 is then reacted with diazomethane or trimethylsilyldiazomethane in an inert solvent such as THF or dichloromethane, and the product diazoketone 41 is then rearranged in the presence of silver (I) oxide to afford the acid 42. Treatment of compound 42 under conditions that specifically remove the protecting carbamate functionality, for example acidic conditions, will then affect cyclization to give compound 43. Reaction of compound 43 with an alkylating agent such as an alkyl iodide, bromide, tosylate or mesylate, or a bis-alkyl iodide, bromide, tosylate or mesylate, under basic conditions, for example butyl lithium in the presence of N,N,N,N-tetramethylene diamine in a solvent such as THF under an inert atmosphere (nitrogen or argon) at a temperature
- 10
- 15
- 20

- 37 -

between -78 °C and the boiling point of the solvent, will then afford the alkylated derivative **44**.

Process for making thiazole derivatives.

5 A method for preparing thiazole derivatives is described below, scheme 18.

Scheme 18

10 Hydrolysis of the ester **29** under basic conditions, for example lithium or sodium hydroxide in THF or methanol at room temperature then gives the acid **45**. Conversion of the acid **45** into the acid chloride **46** is accomplished under standard

- 38 -

conditions, for example thionyl chloride or oxalyl chloride either neat or in the presence of a solvent such as dichloromethane and an additive such as a catalytic amount of N,N-dimethylformamide. Compound 46 is then reacted with diazomethane or trimethylsilyldiazomethane in an inert solvent such as THF or dichloromethane, and

5 the product diazoketone 47 is then rearranged in the presence of silver (I) oxide to afford the acid 48. Treatment of compound 48 under conditions that specifically remove the protecting carbamate functionality, for example acidic conditions, will then affect cyclization to give the heterocycle 49. Reaction of compound 49 with an alkylating agent such as an alkyl iodide, bromide, tosylate or mesylate, or a bis-alkyl

10 iodide, bromide, tosylate or mesylate, under basic conditions, for example butyl lithium in the presence of N,N,N,N-tetramethylene diamine in a solvent such as THF under an inert atmosphere (nitrogen or argon) at a temperature between -78 °C and the boiling point of the solvent, will then afford the alkylated heterocycle 50. Compound 50 may then be converted into the bromide 51. Suitable conditions would be exposure to

15 bromine or N-bromosuccinimide in a solvent such as dichloromethane, THF or acetic acid, the reaction can be carried out under an inert atmosphere (nitrogen or argon) from 0 °C up to the reflux temperature of the solvent in the presence of an additive such as silica gel. Subsequent reaction of compound 51 with an aryl or heteroaryl boronic acid, boronic acid anhydride or trialkyl stannane then provides access to the

20 desired biaryl compound 52. The reaction can be carried out in a solvent such as acetone, ethanol, benzene, toluene or THF, under an inert atmosphere (nitrogen or argon) from 0 °C up to the reflux temperature of the solvent, in the presence of a palladium catalyst such as tetrakis(triphenylphosphine) palladium (0) or palladium acetate and may require an additive such as sodium carbonate, cesium fluoride or

25 potassium phosphate. The thione derivative, compound 53, may be obtained directly by treating 52 with phosphorus pentasulfide in refluxing pyridine. Alternatively 52 may be treated with Lawesson's reagent in refluxing pyridine to afford 53.

The anti-progestin compounds of the formulations of the present invention can be used in the form of salts derived from pharmaceutically or physiologically

acceptable acids or bases. These salts include, but are not limited to, the following salts with inorganic acids such as hydrochloric acid, sulfuric acid, nitric acid, phosphoric acid and, as the case may be, such organic acids as acetic acid, oxalic acid, succinic acid, and maleic acid. Other salts include salts with alkali metals or alkaline earth metals, such as sodium, potassium, calcium or magnesium in the form of esters, carbamates and other conventional "pro-drug" forms, which, when administered in such form, convert to the active moiety *in vivo*.

These methods of treatment may be used for contraception or for the treatment and/or prevention of secondary amenorrhea, dysfunctional bleeding, uterine leiomyomata, endometriosis; polycystic ovary syndrome, carcinomas and adenocarcinomas of the endometrium; ovary, breast, colon, prostate, or minimization of side effects or cyclic menstrual bleeding. Additional uses of the invention include stimulation of food intake.

When the combined compounds are employed for the utilities described above, they may be combined with one or more pharmaceutically acceptable carriers or excipients, for example, solvents, diluents and the like, and may be administered orally in such forms as tablets, capsules, dispersible powders, granules, or suspensions containing, for example, from about 0.05 to 5% of suspending agent, syrups containing, for example, from about 10 to 50% of sugar, and elixirs containing, for example, from about 20 to 50% ethanol, and the like, or parenterally in the form of sterile injectable solutions or suspensions containing from about 0.05 to 5% suspending agent in an isotonic medium. Such pharmaceutical preparations may contain, for example, from about 25 to about 90% of the active ingredient in combination with the carrier, more usually between about 5% and 60% by weight.

These active compounds may be administered orally as well as by intravenous, intramuscular, or subcutaneous routes. Solid carriers include starch, lactose, dicalcium phosphate, microcrystalline cellulose, sucrose and kaolin, while liquid carriers include sterile water, polyethylene glycols, non-ionic surfactants and edible oils such as corn, peanut and sesame oils, as are appropriate to the nature of the active ingredient and the

- 40 -

particular form of administration desired. Adjuvents customarily employed in the preparation of pharmaceutical compositions may be advantageously included, such as flavoring agents, coloring agents, preserving agents, and antioxidants, for example, vitamin E, ascorbic acid, BHT and BHA.

- 5 The preferred pharmaceutical compositions from the standpoint of ease of preparation and administration are solid compositions, particularly tablets and hard-filled or liquid-filled capsules. Oral administration of the compounds is preferred.

- These active compounds may also be administered parenterally or intraperitoneally. Solutions or suspensions of these active compounds as a free base or
10 pharmacologically acceptable salt can be prepared in water suitably mixed with a surfactant such as hydroxypropylcellulose. Dispersions can also be prepared in glycerol, liquid, polyethylene glycols and mixtures thereof in oils. Under ordinary conditions of storage and use, these preparations contain a preservative to prevent the growth of microorganisms.

- 15 The pharmaceutical forms suitable for injectable use include sterile aqueous solutions or dispersions and sterile powders for the extemporaneous preparation of sterile injectable solutions or dispersions. In all cases, the form must be sterile and must be fluid to the extent that easy syringe ability exists. It must be stable under conditions of manufacture and storage and must be preserved against the
20 contaminating action of microorganisms such as bacterial and fungi. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol (e.g., glycerol, propylene glycol and liquid polyethylene glycol), suitable mixtures thereof, and vegetable oil.

- 25 The following non-limiting examples are illustrative of exemplary compound 5.

EXAMPLE 1

6-(3-chlorophenyl)-1,4-dihydro-4,4-dimethyl-2H-thieno[2,3-d][1,3]oxazine-2-one
2-(3-Chlorobenzyl)acetaldehyde

To a 25°C solution of 3-chlorostyrene in anhydrous CH₂Cl₂ (10.0g, 72.15 mmol)
5 was added a well-stirred solution of Pb(OAc)₄ (35.2g, 79.4mmol) in trifluoroacetic
acid (150mL), dropwise. Reaction was completed within 30 minutes of the addition
and after being stirred for a further 30 minutes, the mixture was poured into water,
extracted with ether (3X), the combined organic layers were washed with saturated
NaHCO₃ solution, water, dried (MgSO₄), and concentrated to a volume of about 15
10 mL and immediately used for the following reaction described below.

2-Amino-5-(3-chloro-phenyl)-thiophene-3-carboxylic acid methyl ester

To the crude aldehyde, prepared above, in methanol was added a mixture of
sulfur (2.55g, 79.44mmol), methylcyanoacetate (7.88 g, 79.44 mmol), morpholine
15 (6.92g, 79.44) and the resulting reaction mixture was refluxed for 16 hours. The
unreacted sulfur was filtered off and the filtrates were evaporated leaving behind a
black residue. This residue was extracted with ether, washed with H₂O. Crystallized
from ether/hexane (1:5) to obtain white crystals (3.85g, 14.3mmol, 50%), mp 85-87°;
¹H NMR (DMSO-d₆) δ 3.75 (s, 3H), 7.18-7.27 (m, 1H), 7.31-7.42 (m, 3H), 7.53 (s,
20 1H), 7.62 (s, 1H); MS(+APCI) m/z268(M+H); Anal. Calc. For C₁₂H₁₀ClNO₂S: C,
53.83, H, 3.76, N, 5.23. Found: C, 53.57, H, 3.37, N, 5.00.

2-Allyloxycarbonylamino-5-(3-chloro-phenyl)-thiophene-3-carboxylic acid methyl
ester

25 To a solution of 2-amino-5-(3-chloro-phenyl)-thiophene-3-carboxylic acid
methyl ester (2g, 7.5 mmol) in anhydrous 1,2-dichloroethane (50 mL) was added at
room temperature under nitrogen allyl chloroformate (1.6 mL, 15.1 mmol). The
reaction mixture was heated at reflux under nitrogen for 18 hours, cooled to room
temperature, and treated with a saturated aqueous sodium bicarbonate solution (100

mL). The organic layer was separated and aqueous layer was extracted with methylene chloride (3x20 mL). The combined organic layers were washed (brine) and dried (MgSO₄). After removal of the solvent, the residue was purified by a flash silica gel column (hexane:ethyl acetate/7:1) to give the subtitled compound as an off-white solid (2.14g, 81%): ¹H-NMR (DMSO-*d*₆) δ 10.2 (s, 1H), 7.73 (t, 1H, *J* = 1.7 Hz), 7.66 (s, 1H), 7.57 (dt, 1H, *J* = 7.7, 1.7 Hz), 7.41 (t, 1H, *J* = 7.7 Hz), 7.34 (dt, 1H, *J* = 6.8, 1.6 Hz), 6.01 (m, 1H), 5.41 (dd, 1H, *J* = 7.3, 1.6 Hz), 5.29 (dd, 1H, *J* = 10.5, 1.3 Hz), 4.74 (d, 2H, *J* = 5.5 Hz), 3.84 (s, 3H). Anal. Calc. For C₁₆H₁₄ClNO₄S: C, 54.63, H, 4.01, N, 3.98. Found: C, 54.56, H, 3.92, N, 3.89.

To a solution of 2-allenoxycarbonylamino-5-(3-chloro-phenyl)-thiophene-3-carboxylic acid methyl ester (0.1g, 0.28 mmol) in anhydrous THF was added a solution of methylmagnesium bromide (3.0 M in diethyl ether, 1.5 mL, 4.5 mmol) at room temperature under nitrogen. After stirring at room temperature under nitrogen for 20 minutes, the reaction mixture was treated with brine (10 mL) followed by addition of an aqueous 1N HCl solution (5 mL). Ethyl acetate (20 mL) was added and organic layer was separated, washed with brine (5 mL) and dried over MgSO₄. After removal of solvent, the residue was purified by a flash column (silica gel, hexane:ethyl acetate/5:1) to give carbinol which was used in next step without further purification and characterization.

A mixture of above crude carbinol, potassium hydroxide (excess) in ethanol was stirred at room temperature under nitrogen overnight. The reaction solution was then acidified by an addition of a cold aqueous 1N HCl solution. Ethyl acetate (20 mL) was added and organic layer was separated, washed with brine (5 mL) and dried (MgSO₄). After removal of the solvent, the residue was purified by a silica gel column (hexane:ethyl acetate/2:1) to give the title compound as an off-white solid (16 mg, 19% for two steps): mp 149-150 °C; ¹H-NMR (DMSO-*d*₆) δ 10.69 (s, 1H), 7.64 (t, 1H, *J* = 1.8 Hz), 7.49 (s, 1H), 7.47 (dt, 1H, *J* = 7.7, 1.4 Hz), 7.39 (t, 1H, *J* = 7.8 Hz), 7.29 (dt, 1H, *J* = 7.8, 1.3 Hz), 1.61 (s, 6H). MS (EI) *m/z* 293/295 (M⁺). Anal. Calc. For C₁₄H₁₂ClNO₂S: C, 57.24, H, 4.12, N, 4.77. Found: C, 57.27, H, 4.25, N, 4.66.

EXAMPLE 2**6-(3-chlorophenyl)-1,4-dihydro-4,4-dimethyl-2H-thieno[3,2-d][1,3]oxazine-2-one
3-Chloro-3-(3-chlor-phenyl)-acrylonitrile**

A solution of POCl₃ was slowly added to anhydrous DMF over a period of 20 minutes and the temperature was maintained around 30°C. 3'-Chloroacetophenone solution in anhydrous DMF was added to the above solution and the reaction temperature was allowed to rise to around 50°C. Hydroxylamine HCl was added to the reaction solution, portionwise, over 1 hour. A volume of 500 mL of water was added to form precipitate, stirred for 1 hour and the precipitate was collected on a Büchner funnel, washed with H₂O, and dried to afford a yellow crystalline compound, mp 60-62°C. ¹H NMR (DMSO-d₆) δ 1.60 (s, 6H), 7.30 (d, 1H, J = 8.41Hz), 7.41 (d, 1H, J = 8.41Hz), 10.47 (s, 1H); MS(+APCI)m/z 213(M+H); Anal. Calc. For C₉H₉ClN₂O₂: C, 50.84, H, 4.27, N, 13.17. Found: C, 50.99, H, 4.28, N, 12.98.

3-Amino-5-(3-chloro-phenyl)-thiophene-2-carboxylic acid methyl ester

Sodium pellets were slowly added to methanol solution to form NaOMe in situ, then methyl thioglycolate was added over a period of 20 minutes to the methanol solution. A solution of 3-Chloro-3-(3-chloro-phenyl)-acrylonitrile in methanol was added slowly and was brought to reflux for 1 hour. The reaction mixture was cooled to room temperature and methanol was concentrated to 100 mL and 200 mL of water was added, stirred for 30 min and the yellow precipitate was collected and washed with water several times to yield a yellow crystalline compound, mp 92-95°C. ¹H NMR (DMSO-d₆) δ 1.60 (s, 6H), 7.30 (d, 1H, J = 8.41Hz), 7.41 (d, 1H, J = 8.41Hz), 10.47 (s, 1H); MS (+APCI) m/z 213(M+H); Anal. Calc. For C₉H₉ClN₂O₂: C, 50.84, H, 4.27, N, 13.17. Found: C, 50.99, H, 4.28, N, 12.98.

3-Allyloxycarbonylamino-5-(3-chloro-phenyl)-thiophene-2-carboxylic acid methyl ester

To a solution of 3-Amino-5-(3-chloro-phenyl)-thiophene-2-carboxylic acid methyl ester (15g, 56.0mmol) in toluene (200mL) was added a solution of allyl chloroformate (8.10g, 67.2mmol) in toluene (5.0mL) and the resulting reaction solution was heated under reflux for 3 hours. Toluene was stripped down and the crystals were collected and washed with ether/hexane to afford a yellow crystalline compound, mp 101-103°C. ¹H NMR (DMSO-d₆) δ 3.85 (s, 3H), 4.68-4.71 (d, 2H, *J* = 5.46Hz), 5.26-5.30 (dd, 1H, *J* = 1.35, 9.84Hz), 5.36-5.42 (dd, 1H, *J* = 1.57, 15.68Hz), 5.96 (m, 2H), 7.50-7.52 (m, 2H), 7.67-7.71 (m, 1H), 7.79 (s, 1H), 8.10 (s, 1H); MS(+APCI) *m/z* 352(M+H); Anal. Calc. For C₁₆H₁₄ClNO₄S: C, 54.63, H, 4.01, N, 3.97. Found: C, 54.05, H, 4.17, N, 3.84.

[5-(3-Chloro-phenyl)-2-(1-hydroxy-1-methyl-ethyl)-thiophen-3-yl]-carbamic acid allyl ester

To a solution of 3-Allyloxycarbonylamino-5-(3-chloro-phenyl)-thiophene-2-carboxylic acid methyl ester (5.3g, 15.1mmol) in anhydrous THF (30mL) at room temperature was added a solution of 3.0M MeMgI in ether (20.1mL, 60.24mmol). After 30 minutes, the reaction was slowly quenched with H₂O (10mL), treated with saturated NH₄OH (100mL), extracted with ether (200mL), washed with brine, dried (MgSO₄), concentrated, and chromatographed (hexane/ether, 1:4): mp 60-61; ¹H NMR (DMSO-d₆) δ 1.52 (s, 6H), 4.59-4.61 (d, 2H, *J* = 5.35Hz), 5.22-5.36 (m, 2H), 5.91-6.04 (m, 2H), 7.33-7.67 (m, 5H), 8.89 (s, 1H); MS(EI) *m/z* 351/353(M+H); Anal. Calc. For C₁₇H₁₈ClNO₃S: C, 58.03, H, 5.16, N, 3.98. Found: C, 58.17, H, 5.16, N, 3.97.

6-(3-Chlorophenyl)-1,4-dihydro-4,4-dimethyl-2H-thieno[3,2-d][1,3]oxazin-2-one

To a solution of [5-(3-Chloro-phenyl)-2-(1-hydroxy-1-methyl-ethyl)-thiophen-3-yl]-carbamic acid allyl ester (.12g, .34mmol) in anhydrous THF (5.0mL) was added

- 45 -

KO^tBu (0.076g, 0.068mmol) and stirred for 15 min, quenched with H₂O, and in situ crystallization was carried out by adding minimal amount of MeOH to the solution. The white crystals were collected on a Büchner funnel, mp 123-125°C. ¹H NMR (DMSO-d₆) δ 1.64 (s, 6H), 7.05 (s, 1H), 7.37-7.48 (m, 2H), 7.53-7.56 (s, 1H), 7.67-7.68 (m, 1H), 10.41 (s, 1H); MS(EI) m/z 293/295(M+H); Anal. Calc. For C₁₇H₁₈ClNO₃S: C, 57.24, H, 4.12, N, 4.77. Found: C, 56.93, H, 3.92, N, 4.97.

Example 3 - Pharmacology

The progestational activity of the current invention was evaluated in the PRE-luciferase assay in CV-1 cells, described below. *In-vitro* potencies can be in the range 0.01nM-10,000nM. *In vivo* potencies are anticipated to be in the range 1 mg/kg to 30 mg/kg.

The object of this assay is to determine a compound's progestational or antiprogestational potency based on its effect on PRE-luciferase reporter activity in CV-1 cells co-transfected with human PR and PRE-luciferase plasmids. The materials methods used in the assay are as follows.

a. Medium: The growth medium was as follows: DMEM (BioWhittaker) containing 10% (v/v) fetal bovine serum (heat inactivated), 0.1 mM MEM non-essential amino acids, 100U/ml penicillin, 100mg/ml streptomycin, and 2 mM GlutaMax (GIBCO, BRL). The experimental medium was as follows: DMEM (BioWhittaker), phenol red-free, containing 10% (v/v) charcoal-stripped fetal bovine serum (heat-inactivated), 0.1 mM MEM non-essential amino acids, 100U/ml penicillin, 100mg/ml streptomycin, and 2 mM GlutaMax (GIBCO, BRL).

b. Cell culture, transfection, treatment, and luciferase assay

Stock CV-1 cells are maintained in growth medium. Co-transfection is done using 1.2x10⁷ cells, 5 mg pLEM plasmid with hPR-B inserted at SphI and BamHI sites, 10 mg pGL3 plasmid with two PREs upstream of the luciferase sequence, and 50 mg sonicated calf thymus DNA as carrier DNA in 250 ml.

- 46 -

Electroporation is carried out at 260 V and 1,000 mF in a Biorad Gene Pulser II. After electroporation, cells are resuspended in growth medium and plated in 96-well plate at 40,000 cells/well in 200 μ l. Following overnight incubation, the medium is changed to experimental medium. Cells are then treated with reference or test compounds in experimental medium. Compounds are tested for antiprogestational activity in the presence of 3 nM progesterone. Twenty-four hr. after treatment, the medium is discarded, cells are washed three times with D-PBS (GIBCO, BRL). Fifty μ l of cell lysis buffer (Promega, Madison, WI) is added to each well and the plates are shaken for 15 min in a Titer Plate Shaker (Lab Line Instrument, Inc.). Luciferase activity is measured using luciferase reagents from Promega.

c. Analysis of Results:

Each treatment consists of at least 4 replicates. Log transformed data are used for analysis of variance and nonlinear dose response curve fitting for both agonist and antagonist modes. Huber weighting is used to downweight the effects of outliers. EC₅₀ or IC₅₀ values are calculated from the retransformed values. JMP software (SAS Institute, Inc.) is used for both one-way analysis of variance and non-linear response analyses.

d. Reference Compounds:

Progesterone and trimegestone are reference progestins and RU486 is the reference antiprogestin. All reference compounds are run in full dose-response curves and the EC₅₀ or IC₅₀ values are calculated.

Table 1. Estimated EC₅₀, standard error (SE), and 95% confidence intervals (CI) for reference progestins from three individual studies

5	<u>Compound</u>	<u>Exp.</u>	<u>EC₅₀</u>	<u>SE</u>	<u>95% CI</u>	
			(nM)		lower	upper
	Progesterone	1	0.616	0.026	0.509	0.746
		2	0.402	0.019	0.323	0.501
		3	0.486	0.028	0.371	0.637
10	Trimegestone	1	0.0075	0.0002	0.0066	0.0085

		3	0.0067	0.0003	0.0055	0.0082

Table 2. Estimated IC₅₀, standard error (SE), and 95% confident interval (CI) for the antiprogestin, RU486 from three individual studies

15	<u>Compound</u>	<u>Exp.</u>	<u>IC 50</u>	<u>SE</u>	<u>95% CI</u>	
			(nM)		lower	upper
20	RU486	1	0.028	0.002	0.019	0.042
		2	0.037	0.002	0.029	0.048
		3	0.019	0.001	0.013	0.027

Progestational activity: Compounds that increase PRE-luciferase activity significantly ($p < 0.05$) compared to vehicle control are considered active.

Antiprogestational activity: Compounds that decrease 3 nM progesterone induced PRE-luciferase activity significantly ($p < 0.05$)

EC₅₀: Concentration of a compound that gives half-maximal increase PRE-luciferase activity (default-nM) with SE.

IC₅₀: Concentration of a compound that gives half-maximal decrease in 3 nM progesterone induced PRE-luciferase activity (default-nM) with SE.

All publications cited in this specification are incorporated herein by reference herein. While the invention has been described with reference to a particularly preferred embodiment, it will be appreciated that modifications can be made without departing from the spirit of the invention. Such modifications are intended to fall within the scope of the appended claims.

What is Claimed:

1. A method of contraception which comprises administering to a female of child bearing age for 28 consecutive days:

- a) a first phase of from 14 to 24 daily dosage units of a progestational agent equal in progestational activity to about 35 to about 100 μ g levonorgestrel;
- b) a second phase of from 1 to 11 daily dosage units, at a daily dosage of from about 2 to 50 mg, of an antiprogestin compound of Formula 1:

wherein:

A and B are independent substituents selected from S, CH or N;

Provided that when A is S, B is CH or N; provided that

when B is S, A is CH or N;

and A and B cannot both be CH;

and when A and B both equal N, one N may be optionally substituted with an C₁ to C₆ alkyl group;

R₁ and R₂ are independent substituents selected from the group of H, C₁ to C₆ alkyl, substituted C₁ to C₆ alkyl, C₂ to C₆ alkenyl, substituted C₂ to C₆ alkenyl, C₂ to C₆ alkynyl, substituted C₂ to C₆ alkynyl, C₃ to C₈ cycloalkyl, substituted C₃ to C₈ cycloalkyl, aryl, substituted aryl, heterocyclic, substituted heterocyclic, COR^A, or NR^BCOR^A;

or R¹ and R² are fused to form:

- a) an optionally substituted 3 to 8 membered spirocyclic alkyl ring; or

b) an optionally substituted 3 to 8 membered spirocyclic alkenyl ring; or

c) an optionally substituted 3 to 8 membered spirocyclic ring containing one to three heteroatoms selected from the group of O, S and N;

R^A is H, C_1 to C_3 alkyl, substituted C_1 to C_3 alkyl, aryl, substituted aryl, C_1 to C_3 alkoxy, substituted C_1 to C_3 alkoxy, C_1 to C_3 aminoalkyl, or substituted C_1 to C_3 aminoalkyl;

R^B is H, C_1 to C_3 alkyl, or substituted C_1 to C_3 alkyl;

R^3 is H, OH, NH_2 , C_1 to C_6 alkyl, substituted C_1 to C_6 alkyl, C_3 to C_6 alkenyl, substituted C_1 to C_6 alkenyl, alkynyl, or substituted alkynyl, or COR^C ;

R^C is H, C_1 to C_3 alkyl, substituted C_1 to C_3 alkyl, aryl, substituted aryl, C_1 to C_3 alkoxy, substituted C_1 to C_3 alkoxy, C_1 to C_3 aminoalkyl, or substituted C_1 to C_3 aminoalkyl;

R^4 is a trisubstituted benzene ring containing the substituents X, Y and Z as shown below,

X is selected from halogen, CN, C_1 to C_3 alkyl, substituted C_1 to C_3 alkyl, C_1 to C_3 alkoxy, substituted C_1 to C_3 alkoxy, C_1 to C_3 thioalkyl, substituted C_1 to C_3 thioalkyl, C_1 to C_3 aminoalkyl, substituted C_1 to C_3 aminoalkyl, NO_2 , C_1 to C_3 perfluoroalkyl, 5 or 6 membered heterocyclic ring containing 1 to 3 heteroatoms, COR^D , $OCOR^D$, or $NR^E COR^D$;

- 51 -

R^D is H, C_1 to C_3 alkyl, substituted C_1 to C_3 alkyl, aryl, substituted aryl, C_1 to C_3 alkoxy, substituted C_1 to C_3 alkoxy, C_1 to C_3 aminoalkyl, or substituted C_1 to C_3 aminoalkyl;

R^E is H, C_1 to C_3 alkyl, or substituted C_1 to C_3 alkyl;

Y and Z are independently selected from H, halogen, CN, NO_2 , C_1 to C_3 alkoxy, C_1 to C_3 alkyl, or C_1 to C_3 thioalkyl;

or

R^4 is a five or six membered ring with 1, 2, or 3 heteroatoms selected from O, S, SO, SO_2 or NR^5 , the five or six membered rings being optionally substituted by one or two independent substituents selected from H, halogen, CN, NO_2 and C_1 to C_3 alkyl, C_1 to C_3 alkoxy, C_1 to C_3 aminoalkyl, COR^F , or $NR^G COR^F$;

R^F is H, C_1 to C_3 alkyl, substituted C_1 to C_3 alkyl, aryl, substituted aryl, C_1 to C_3 alkoxy, substituted C_1 to C_3 alkoxy, C_1 to C_3 aminoalkyl, or substituted C_1 to C_3 aminoalkyl;

R^G is H, C_1 to C_3 alkyl, or substituted C_1 to C_3 alkyl;

R^5 is H, or C_1 to C_3 alkyl;

W is O or a chemical bond;

or a pharmaceutically acceptable salt thereof; and

c) optionally, a third phase of daily dosage units of an orally and pharmaceutically acceptable placebo for the remaining days of the 28 consecutive days

in which no antiprogestin, progestin or estrogen is administered; wherein the total daily dosage units of the first, second and third phases equals 28.

2. A method of Claim 1 wherein the progestational agent is levonorgestrel and the anti-progestin compound is selected from those of Formula 1 of Claim 1 wherein:

A and B are independent substituents S, CH or N,
provided that when A is S, B is CH or N; and
when B is S, A is CH or N; and
A and B cannot both be CH; and
when A and B both equal N, one N may be optionally substituted with
an C₁ to C₆ alkyl group;

R¹ is H, C₁ to C₆ alkyl, substituted C₁ to C₆ alkyl, C₃ to C₈ cycloalkyl, substituted C₃ to C₈ cycloalkyl, aryl, substituted aryl, heterocyclic, substituted heterocyclic, COR^A, or NR^BCOR^A;

R² is H, C₁ to C₆ alkyl, substituted C₁ to C₆ alkyl, C₂ to C₆ alkenyl, substituted C₂ to C₆ alkenyl, C₂ to C₆ alkynyl, substituted C₂ to C₆ alkynyl, C₃ to C₈ cycloalkyl, substituted C₃ to C₈ cycloalkyl, aryl, substituted aryl, heterocyclic, substituted heterocyclic, COR^A, or NR^BCOR^A;

or R¹ and R² are fused to form:

- a) an optionally substituted 3 to 8 membered spirocyclic alkyl ring; or
- b) an optionally substituted 3 to 8 membered spirocyclic alkenyl ring;

or

- c) an optionally substituted 3 to 8 membered spirocyclic ring containing one to three heteroatoms selected from the group of O, S and N;

R^A is H, C₁ to C₃ alkyl, substituted C₁ to C₃ alkyl, aryl, substituted aryl, C₁ to C₃ alkoxy, substituted C₁ to C₃ alkoxy, C₁ to C₃ aminoalkyl, or substituted C₁ to C₃ aminoalkyl;

- 53 -

R^B is H, C_1 to C_3 alkyl, or substituted C_1 to C_3 alkyl;

R^3 is H, OH, NH_2 , C_1 to C_6 alkyl, substituted C_1 to C_6 alkyl, C_3 to C_6 alkenyl, substituted C_1 to C_6 alkenyl, alkynyl, or substituted alkynyl, or COR^C ;

R^C is H, C_1 to C_4 alkyl, substituted C_1 to C_4 alkyl, aryl, substituted aryl, C_1 to C_4 alkoxy, substituted C_1 to C_4 alkoxy, C_1 to C_4 aminoalkyl, or substituted C_1 to C_4 aminoalkyl;

R^4 is a trisubstituted benzene ring containing the substituents X, Y and Z as shown below:

X is taken from the group including halogen, CN, C_1 to C_3 alkyl, substituted C_1 to C_3 alkyl, C_1 to C_3 alkoxy, substituted C_1 to C_3 alkoxy, C_1 to C_3 thioalkyl, substituted C_1 to C_3 thioalkyl, C_1 to C_3 aminoalkyl, substituted C_1 to C_3 aminoalkyl, NO_2 , C_1 to C_3 perfluoroalkyl, 5-membered heterocyclic ring containing 1 to 3 heteroatoms, COR^D , $OCOR^D$, or $NR^E COR^D$;

R^D is H, C_1 to C_3 alkyl, substituted C_1 to C_3 alkyl, aryl, substituted aryl, C_1 to C_3 alkoxy, substituted C_1 to C_3 alkoxy, C_1 to C_3 aminoalkyl, or substituted C_1 to C_3 aminoalkyl;

R^E is H, C_1 to C_3 alkyl, or substituted C_1 to C_3 alkyl;

Y and Z are independent substituents taken from the group including H, halogen, CN, NO_2 , C_1 to C_3 alkoxy, C_1 to C_3 alkyl, or C_1 to C_3 thioalkyl;

- 54 -

or

R⁴ is a five or six membered ring with 1, 2, or 3 heteroatoms selected from O, S, SO, SO₂ or NR⁵, the five or six membered ring being optionally substituted by one or two independent substituents selected from H, halogen, CN, NO₂ and C₁ to C₃ alkyl, or C₁ to C₃ alkoxy;

R⁵ is H or C₁ to C₃ alkyl;

W is O or a chemical bond
or a pharmaceutically acceptable salt thereof.

3. A method of Claim 1 wherein the progestational agent is levonorgestrel and the anti-progestin compound is selected from those of Formula 1 of Claim 1 wherein:

A and B are independent substituents from the group including S, CH or N;

provided that when A is S, B is CH or N; and

when B is S, A is CH or N; and

A and B cannot both be CH;

R¹ = R² and are selected from the group which includes C₁ to C₃ alkyl, substituted C₁ to C₃ alkyl, or spirocyclic alkyl constructed by fusing R¹ and R² to form a 3 to 6 membered spirocyclic ring;

R³ is H, OH, NH₂, C₁ to C₆ alkyl, substituted C₁ to C₆ alkyl, or COR^C;

R^C is H, C₁ to C₄ alkyl, or C₁ to C₄ alkoxy;

R⁴ is a disubstituted benzene ring containing the substituents X and Y as shown below:

- 55 -

X is selected from the group including halogen, CN, C₁ to C₃ alkoxy, C₁ to C₃ alkyl, NO₂, C₁ to C₃ perfluoroalkyl, 5 membered heterocyclic ring containing 1 to 3 heteroatoms, or C₁ to C₃ thioalkyl;

Y is a substituent on the 4' or 5' position selected from the group of H, halogen, CN, NO₂, C₁ to C₃ alkoxy, C₁ to C₄ alkyl, or C₁ to C₃ thioalkyl;

or

R⁴ is a five membered ring with the structure shown below:

U is O, S, or NR⁵;

R⁵ is H, or C₁ to C₃ alkyl, or C₁ to C₄ CO₂alkyl;

X' is selected from halogen, CN, NO₂, C₁ to C₃ alkyl or C₁ to C₃ alkoxy;

Y' is H or C₁ to C₄ alkyl;

or

R⁴ is a six membered ring with the structure:

- 56 -

X^1 is N or CX^2 ,
 X^2 is halogen, CN or NO_2 ;
W is O or a chemical bond;
or a pharmaceutically acceptable salt thereof.

4. A method of Claim 1 wherein the progestational agent is levonorgestrel and the anti-progestin compound is selected from those of Formula 1 of Claim 1 wherein:

$R^1 = R^2$ and are selected from the group which includes C_1 to C_3 alkyl, substituted C_1 to C_3 alkyl, or spirocyclic alkyl constructed by fusing R^1 and R^2 to form a 3 to 6 membered spirocyclic ring;
and A, B, R^3 , R^C , R^4 , X, Y, U, R^5 , X' , Y' , X^1 , X^2 , R^6 , R^7 , R^8 , R^9 and W are as defined in Claim 3;
or a pharmaceutically acceptable salt thereof.

5. A method of Claim 1 wherein the progestational agent is levonorgestrel and the anti-progestin compound is selected from those of Formula 1 of Claim 1 wherein:

R^1 and R^2 are fused to form a 3 to 6 membered spirocyclic ring;
and A, B, R^3 , R^C , R^4 , X, Y, U, R^5 , X' , Y' , X^1 , X^2 , R^6 , R^7 , R^8 , R^9 and W are as defined in Claim 3;
or a pharmaceutically acceptable salt thereof.

6. A method of contraception which comprises administering to a female of child bearing age for 28 consecutive days:

a) a first phase of from 14 to 24 daily dosage units of a progestational agent equal in progestational activity to about 35 to about 100 μ g levonorgestrel;

- 57 -

b) a second phase of from 1 to 11 daily dosage units, at a daily dosage of from about 2 to 50 mg, of an antiprogesterin compound of the formula:

wherein:

R_1 and R_2 are independent substituents selected from the group of H, C_1 to C_6 alkyl, substituted C_1 to C_6 alkyl, C_2 to C_6 alkenyl, substituted C_2 to C_6 alkenyl, C_2 to C_6 alkynyl, substituted C_2 to C_6 alkynyl, C_3 to C_8 cycloalkyl, substituted C_3 to C_8 cycloalkyl, aryl, substituted aryl, heterocyclic, substituted heterocyclic, COR^A , or $NR^B COR^A$,

or R^1 and R^2 are fused to form:

a) a 3 to 6 membered spirocyclic alkyl ring; or

b) a 3 to 6 membered spirocyclic alkenyl ring;

R^3 is H, OH, NH_2 , C_1 to C_6 alkyl, substituted C_1 to C_6 alkyl, C_3 to C_6 alkenyl, substituted C_1 to C_6 alkenyl, alkynyl, or substituted alkynyl, or COR^C ;

R^B is H, C_1 to C_3 alkyl, or substituted C_1 to C_3 alkyl;

R^C is H, C_1 to C_3 alkyl, substituted C_1 to C_3 alkyl, aryl, substituted aryl, C_1 to C_3 alkoxy, substituted C_1 to C_3 alkoxy, C_1 to C_3 aminoalkyl, or substituted C_1 to C_3 aminoalkyl;

- 58 -

R^4 is a trisubstituted benzene ring containing the substituents X, Y and Z as shown below,

X is selected from halogen, CN, C_1 to C_3 alkyl, substituted C_1 to C_3 alkyl, C_1 to C_3 alkoxy, substituted C_1 to C_3 alkoxy, C_1 to C_3 thioalkyl, substituted C_1 to C_3 thioalkyl, C_1 to C_3 aminoalkyl, substituted C_1 to C_3 aminoalkyl, NO_2 , C_1 to C_3 perfluoroalkyl, 5 or 6 membered heterocyclic ring containing 1 to 3 heteroatoms, COR^D , $OCOR^D$, or $NR^E COR^D$;

R^D is H, C_1 to C_3 alkyl, substituted C_1 to C_3 alkyl, aryl, substituted aryl, C_1 to C_3 alkoxy, substituted C_1 to C_3 alkoxy, C_1 to C_3 aminoalkyl, or substituted C_1 to C_3 aminoalkyl;

R^E is H, C_1 to C_3 alkyl, or substituted C_1 to C_3 alkyl; and

Y and Z are independently selected from H, halogen, CN, NO_2 , C_1 to C_3 alkoxy, C_1 to C_3 alkyl, or C_1 to C_3 thioalkyl; or a pharmaceutically acceptable salt thereof; and

c) optionally, a third phase of daily dosage units of an orally and pharmaceutically acceptable placebo for the remaining days of the 28 consecutive days in which no antiprogesterin, progestin or estrogen is administered; wherein the total daily dosage units of the first, second and third phases equals 28.

7. A method of Claim 1 in which the antiprogesterin compound is 6-(3-chlorophenyl)-1,4-dihydro-4,4-dimethyl-2H-thieno[2,3-d][1,3]oxazine-2-one, or a pharmaceutically acceptable salt thereof.

8. The method of Claim 1 wherein the progestational agent is selected from the group of levonorgestrel, norgestrel, desogestrel, 3-ketodesogestrel, norethindrone, gestodene, norethindrone acetate, norgestimate, osaterone, cyproterone acetate, trimegestone, dienogest, drospirenone, nomegestrol, or (17-deacetyl)norgestimate.

9. A method of Claim 1 which comprises administering to a female of child bearing age consecutively over a 28 day cycle:

- a) a first phase of 21 daily dosage units of a progestational agent equal in progestational activity to about 35 to about 100 μg levonorgestrel;
- b) a second phase of 3 daily dosage units of an antiprogestin compound of Claim 1, each daily dosage unit containing an antiprogestin compound at a daily dosage of from about 2 to 50 mg; and
- c) optionally, 4 daily dosage units of an orally and pharmaceutically acceptable placebo to be administered on each day of the 28-day cycle following the first phase and second phase.

10. A method of contraception which comprises administering to a female of child bearing age over a period of 28 consecutive days:

- a) a first phase of from 18 to 21 daily dosage units of a progestostational agent equal in progestational activity to about 35 to about 150 μg levonorgestrel, and ethinyl estradiol at a daily dose range of from about 10 to about 35 μg ; and
- b) a second phase of from 1 to 7 daily dosage units of an antiprogestin of Claim 1 at a daily dose of from about 2 to 50 mg; and
- c) optionally, an orally and pharmaceutically acceptable placebo for each remaining day of the 28 consecutive days.

- 60 -

11. A method of contraception of Claim 10 which comprises administering to a female of child bearing age over a period of 28 consecutive days:

- a) a first phase of 21 daily dosage units of a progestostational agent equal in progestational activity to about 35 to about 100 μg levonorgestrel and ethinyl estradiol at a daily dose range of from about 10 to about 35 μg ; and
- b) a second phase of 3 daily dosage units of an antiprogesterin of Claim 1 at a daily dose of from about 2 to 50 mg; and
- c) optionally, a third phase of 4 daily dosage units of an orally and pharmaceutically acceptable placebo.

12. A method of contraception which comprises administering to a female of child bearing age over a period of 28 consecutive days:

- a) a first phase of from 18 to 21 daily dosage units containing a progestational agent at a daily dose equal in progestational activity to from about 35 to about 150 μg levonorgestrel and ethinyl estradiol at a daily dose range of from about 10 to about 35 μg
- b) a second phase of from 1 to 7 daily dose units, each daily dose unit containing an antiprogesterin of Claim 1 at a concentration of from 2 to 50 mg and ethinyl estradiol at a concentration of from about 10 to about 35 μg ; and
- c) optionally, a third phase of daily dosage units of an orally and pharmaceutically acceptable placebo, the total of the daily dosage units being 28.

13. A method of contraception of Claim 12 which comprises administering to a female of child bearing age over a period of 28 consecutive days:

- a) a first phase of 21 daily dosage units, each daily dosage unit containing a progestational agent at a daily dose equal in progestational activity to about 35 to about 100 μg levonorgestrel and ethinyl estradiol at a daily dose range of from about 10 to about 35 μg

- 61 -

b) a second phase of 3 daily dose, each daily dose unit containing an antiprogestin of Claim 1 at a concentration of from 2 to 50 mg; and ethinyl estradiol at a concentration of from about 10 to about 35 µg; and

c) optionally, a third phase of 4 daily dosage units of an orally and pharmaceutically acceptable placebo.

14. A pharmaceutically useful kit adapted for daily oral administration which comprises:

a) a first phase of from 14 to 21 daily dosage units of a progestational agent equal in progestational activity to about 35 to about 150 µg levonorgestrel;

b) a second phase of from 1 to 11 daily dosage units of an antiprogestin compound of Claim 1, each daily dosage unit containing an antiprogestin compound at a daily dosage of from about 2 to 50 mg; and

c) a third phase of daily dosage units of an orally and pharmaceutically acceptable placebo;

wherein the total number of the daily dosage units in the first phase, second phase and third phase equals 28.

15. A pharmaceutically useful kit adapted for daily oral administration of Claim 14 which comprises:

a) a first phase of 21 daily dosage units of a progestational agent equal in progestational activity to about 35 to about 150 µg levonorgestrel;

b) a second phase of 3 daily dosage units of an antiprogestin compound of Claim 1, each daily dosage unit containing an antiprogestin compound at a daily dosage of from about 2 to 50 mg; and

c) a third phase of 4 daily dosage units of an orally and pharmaceutically acceptable placebo.

16. A pharmaceutically useful kit adapted for daily oral administration which comprises:

- a) a first phase of from 18 to 21 daily dosage units of a progestostational agent equal in progestational activity to about 35 to about 150 μg levonorgestrel and ethinyl estradiol at a daily dose range of from about 10 to about 35 μg ; and
- b) a second phase of from 1 to 7 daily dosage units of an antiprogestin of Claim 1 at a daily dose of from about 2 to 50 mg; and
- c) a third phase of from 0 to 9 daily dosage units of an orally and pharmaceutically acceptable placebo;

wherein the total number of the daily dosage units in the first phase, second phase and third phase equals 28.

17. A pharmaceutically useful kit adapted for daily oral administration of Claim 16 which comprises:

- a) a first phase of 21 daily dosage units of a progestostational agent equal in progestational activity to about 35 to about 150 μg levonorgestrel and ethinyl estradiol at a daily dose range of from about 10 to about 35 μg ; and
- b) a second phase of three daily dosage units of an antiprogestin of Claim 1 administered at a daily dose of from about 2 to 50 mg; and
- c) a third phase of 4 daily dosage units of an orally and pharmaceutically acceptable placebo.

18. A pharmaceutically useful kit adapted for daily oral administration which comprises:

- a) a first phase of from 18 to 21 daily dosage units, each daily dosage unit comprising a progestational agent at a daily dose equal in progestational activity to from about 35 to about 150 μg levonorgestrel and ethinyl estradiol at a daily dose range of from about 10 to about 35 μg

- 63 -

b) a second phase of from 1 to 7 daily dose units, each daily dose unit containing an antiprogesterin of Claim 1 at a concentration of from 2 to 50 mg; and ethinyl estradiol at a concentration of from about 10 to about 35 µg; and

c) a third phase of from 0 to 9 daily dosage units of an orally and pharmaceutically acceptable placebo;

wherein the total number of the daily dosage units in the first phase, second phase and third phase equals 28.

19. A pharmaceutically useful kit adapted for daily oral administration of Claim 18 which comprises:

a) a first phase of 21 daily dosage units, each containing a progestational agent of this invention at a daily dose equal in progestational activity to about 35 to about 150 µg levonorgestrel and ethinyl estradiol at a daily dose range of from about 10 to about 35 µg

b) a second phase of 3 daily dose units, each daily dose unit containing an antiprogesterin of Claim 1 at a concentration of from 2 to 50 mg; and ethinyl estradiol at a concentration of from about 10 to about 35 µg; and

c) a third phase of 4 daily dosage units of an orally and pharmaceutically acceptable placebo.

INTERNATIONAL SEARCH REPORT

International Application No
PCT/US 00/11846

A. CLASSIFICATION OF SUBJECT MATTER
IPC 7 A61P15/18 A61K45/06 A61K31/57 A61K31/565 //(A61K31/57,

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Present claims 1-6,8-19 relate to an extremely large number of possible compounds. Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Present claims 1,6-7,9-19 relate to a compound defined by reference to a desirable characteristic or property, namely the progestational activity. The claims cover all compounds having this characteristic or property, whereas the application provides support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT for only a very limited number of such compounds. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Independent of the above reasoning, the claims also lack clarity (Article 6 PCT). An attempt is made to define the compound by reference to a result to be achieved. Again, this lack of clarity in the present case is such as to render a meaningful search over the whole of the claimed scope impossible.

Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely those parts relating to the combinations containing the compounds explicitly mentioned in the examples of the description, with due regard to the general idea underlying the present invention.

Claims searched completely: none.
Claims searched incompletely: 1-19.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.

(54) Title: CONTRACEPTIVE COMPOSITIONS CONTAINING CYCLIC CARBAMATES AND AMIDE DERIVATIVES

(57) Abstract: This invention relates to cyclic combination therapies and regimens utilizing, in combination with progestins, estrogens, or both, substituted indoline derivative compounds which are antagonists of the progesterone receptor having general structure (I) wherein A and B are independent substituents selected from S, CH or N; provided that when A is S, B is CH or N; and when B is S, A is CH or N; and A and B cannot both be CH; and when A and B both equal N, one N may be optionally substituted with a C₁ to C₆ alkyl group; R₁ and R₂ are independent substituents selected from the group of H, C₁ to C₆ alkyl, substituted C₁ to C₆ alkyl, C₂ to C₆ alkenyl, substituted C₂ to C₆ alkenyl, C₂ to C₆ alkynyl, substituted C₂ to C₆ alkynyl, C₃ to C₈ cycloalkyl, substituted C₃ to C₈ cycloalkyl, aryl, substituted aryl, heterocyclic, substituted heterocyclic, COR^A, or NR^BCOR^A; or R¹ and R² are fused to form

optionally substituted 3 to 8 membered spirocyclic alkyl, alkenyl or heterocyclic ring, the heterocyclic ring containing one to three heteroatoms selected from the group of O, S and N; or pharmaceutically useful salts thereof. These methods of treatment may be used for contraception or for the treatment and/or prevention of secondary amenorrhea, dysfunctional bleeding, uterine leiomyomata, endometriosis, polycystic ovary syndrome, carcinomas and adenocarcinomas of the endometrium, ovary, breast, colon, prostate, or minimization of side effects or cyclic menstrual bleeding. Additional uses of the invention include stimulation of food intake.
